

BUSINESS BUILT BETTER

Architectures for real-world customer challenges

CAMPUS & BRANCH

Industry: Financial Services

Focus: Securely Enabling Wireless

By offering a solution from the device to the data center and everything in between, for many customers, Juniper is a one-stop shop.

The Challenge: Mobility use is soaring in the enterprise. And their IT staff is struggling with how to address the sudden influx of mobile devices and their resulting demands on the network. They're also concerned with losing control and of course, security.

Trusted user devices, whether corporate-owned or employee-owned, need to be secured and controlled. And guest devices need to be isolated. Ultimately, both trusted and untrusted devices need reliable access and they need the ability to deliver a consistent user experience.

People want the ease-of-use and productivity of smart phones and tablets and they're increasingly bringing their own devices if they're not provided by employers. This new Bring Your Own Device trend is leading to many challenges controlling the network, with security being the most critical. And Juniper is leading the industry by providing an all-encompassing solution for the BYOD trend and traditional corporate mobile access for employer-owned and guest devices.

The Solution: Juniper is the only vendor that provides a complete campus solution from access through WAN including comprehensive security. It's delivered by the Simply Connected integrated portfolio of resilient wired, wireless and security products that enable mobility at scale.

Juniper's solutions offer great flexibility in the services they can run. The SRX is one consolidated device that delivers security, routing and switching including advanced security like web filtering and application security. Additional security services can be added to it just by turning on a software license. The SRX also has a modular design and accepts a full line of WAN connectivity options. Plus, users can swap out cards to change the WAN connectivity or add additional network cards to increase the port density. Like many Juniper Networks devices, it's built to last because it can scale.

Juniper also offers Junos Space to help ease managing a wide portfolio of products. Simply Connected combines wireless LANs, routing, switching and security to deliver seamless connectivity for the campus and branch. And a single Junos operating system leads to cost savings, efficiency and workforce productivity that enables BYOD and connectivity anywhere.
